

# CloseAll 1.5

*When we see that a game is lagging, we usually say: “wait, let me close all programs”, then we minimize the game, and we try to figure out what is opened, so we can close it and possibly reduce lagging. Lags are mostly caused by programs, internet browsers, or some unexpected activity in programs we forgot opened. Sometimes we need to close many different things, and sometimes can happen that we close the AOC or the Voobly in that important moment.*

“CloseAll 1.5” is a small attractively designed tool for closing all unwanted programs and processes which are not connected with a game. Pressing a one single button “Close all”, user is available to close all pre defined processes or applications, and keep only a game online client and the game.

In simply words, we can fast close all programs and processes, keeping AOC and Voobly (and also, some other tools we need to play like: Save Chapter tool, Messenger, Skype). Also, program can be used for any other game.

With implemented CPU (Processor) usage monitor, we can easily see what is going on with CPU in real time. It shows if CPU is currently busy with some other applications, and that's a first sign that we have some unwanted application. (normally, AOC when is minimized, and Voobly, don't take much % of CPU usage).

## How to install:

- 1) Unpack the program folder somewhere on computer (e.g. C:\Program Files\CloseAll 1.5\)
- 2) Restart your computer ( don't start the program before restarting )
- 3) After restarting of computer, start only AOC & Voobly, and all other what you need for playing (it's highly recommended to open MSN if you use it, or any other communication tool which you will normally use all time).
- 4) Open the CloseAll 1.5.exe program and, when you start for the first time, you will see Welcome screen. Read it and press “ok” to close that screen, and the main program user interface will appear.
- 5) **This is most important thing when you start the program for the first time: click “R” button in left corner of the program interface, with left mouse. (this will define a list of “wanted applications” which you wish to use when you are playing. And also, in this list will be included all system startup processes which are started for Windows). You need to do this step correctly, or else you can close AOC too.**
- 6) After, you can check defined list of wanted applications, make sure all is listed there: go to program's folder “\CloseAll 1.5\” and open “process\_list.txt”, and see all applications you wanted are there. (it's not recommended to edit this file manually! Programs which are not listed, will be terminated on “Close all”)
- 7) You are ready to use the program. When you play a game and notice some lags, minimize the game, and start this program. You will be able to see CPU activity and close all unwanted programs pressing “Close all”, the main button of program. Make a shortcut and copy it on desktop or to “Quick lunch” icons.
- 8) **IMPORTANT: This program closes applications by termination. Keep in mind that terminated program will not save current data and work. Be careful to save your work before you use closing. Messenger and similar programs don't put conversations into history if they are terminated. Most of serious programs, such as Photoshop, don't save data if they are terminated. However, internet browsers mostly recover opened pages on next start... Use the program with special care, so it can be useful to you, not harmful.**

Happy playing AOC, enjoy ;)
